# SCIENCE 10 UNIT C: BIOLOGY THE MICROSCOPE

# SCIENCE, TECHNOLOGY, AND SOCIETY (STS)

- Science and technology go hand in hand
- Sometimes, science drives technology
  - Research into electromagnetic radiation led to the radio
- Sometimes, technology drives science
  - Microscopes

# THE MICROSCOPE

- <u>Microscopes</u> are perhaps the strongest example of technology driving science
- Massive impacts on the field of biology
- <u>https://www.youtube.</u> <u>com/watch?v=bjcewKLl</u> <u>b2Y&ab\_channel=State</u> <u>dClearly</u>

# THE MICROSCOPE

 Three things affect microscope imaging

#### Magnification

• How much larger is the image

#### <u>Contrast</u>

Is it high enough to distinguish

#### <u>Resolution</u>

 Ability to distinguish between two nearby structures

# THE MICROSCOPE

#### We can increase contrast using a <u>stain</u>

### VAN LEEUWENHOEK'S MICROSCOPE

- A <u>simple</u> microscope, had only <u>one</u> lens
  - Like a magnifying glass
- Observed bacteria, yeast, and other microbes as a hobby
- Kept careful records, helped science

### FOCUSING WITHOUT LENSES -INUIT

# ROBERT HOOKE'S MICROSCOPE

- Built a microscope with two lenses, called a <u>compound</u> <u>microscope</u>
- One set of lenses <u>enlarges</u> the object
- The other set <u>magnifies</u> the image
- Coined the term <u>cells</u> while observing cork (see image)

# MICROSCOPE PARTS EXPLAINED

- Body tube
  - Connects the eyepiece to the microscope
- Revolving nosepiece
  - Switches between objective lenses
- Objective lenses
  - Magnify the specimen at 4x, 10x, or 40x
- Stage clips
  - Hold the sample slide in place

# MICROSCOPE PARTS EXPLAINED

- Iris diaphragm
  - Controls the light level
- Light source
  - Provides the light for the slide
- Eyepiece
  - Look here to view the sample
- Arm
  - Connects the base and the body tube

# MICROSCOPE PARTS EXPLAINED

- Stage
  - Flat platform where you place your slides
- Coarse adjustment knob
  - Focuses the lenses on a sample
- Fine adjustment knob
  - Precisely focuses the lenses on a sample
- Base
  - Supports the microscope

### ELECTRON MICROSCOPES

- Invented in the 1930s by Germany, two kinds
- Use <u>electrons</u>, which are much <u>smaller</u> than photons
- Allows resolution of <u>smaller</u> images, like <u>viruses</u>
- Viewed on a screen or special image called a <u>micrograph</u>

https://www.yo utube.com/watc h?v=oSCX78-8q0

### TRANSMISSION ELECTRON MICROSCOPE

- Uses thin slices of specimens, like light microscopes
- Can only view dead specimens, like COVID seen below

### SCANNING ELECTRON MICROSCOPE

- Bounces electrons off surfaces to give 3D images
- Can analyze living specimens
- Who can guess what's in the image below?

# THE NEWEST MICROSCOPES

- Confocal Laser Scanning microscopes (<u>CLSM</u>)
  - A light microscope, uses lasers to see through thick specimens instead of slices

#### Scanning Tunneling Microscope

 Maps surfaces using a metal probe that exchanges electrons with the surface
